

## Exceptions to Mendel's Laws

### Intermediate Phenotypes

### So far....

- ◆ TALL or SHORT
- ◆ WHITE or PURPLE
- ◆ CURLY or STRAIGHT

### So far...

- ◆ Complete dominance
  - ◆ one allele completely **COVERS** up the other
  - ◆ a true relationship of dominance and recessiveness
  - ◆ only two phenotypic outcomes
- ◆ Ex.
 

◆ R= red	→	◆ RR= red
◆ r= white		◆ Rr= red
		◆ rr= white

### But, what if . . .

- ◆ RED, PURPLE, or BLUE
- ◆ SHORT, MEDIUM, or TALL
- ◆ CURLY, WAVY, or STRAIGHT

## Intermediate Inheritance

- ◆ **Incomplete dominance**
  - ◆ when neither allele covers up the other
  - ◆ In the heterozygous, you fail to see **EITHER TRAIT PURELY!**
  - ◆ three phenotypic outcomes
- ◆ Ex.
 

◆ R= red	→	◆ RR= red
◆ R'= white		◆ RR'= pink
		◆ R'R'= white

## Incomplete Dominance

## Practice

- ◆ In snapdragons, flower color is controlled by incomplete dominance. The two alleles are red ( $R$ ) and white ( $R'$ ). The heterozygous genotype is expressed as pink.
- a) What is the phenotype of a plant with the genotype  $RR$ ?
- b) What is the phenotype of a plant with the genotype  $R'R'$ ?
- c) What is the phenotype of a plant with the genotype  $RR'$ ?

## Intermediate Inheritance

### ◆ Codominance

- ◆ when BOTH alleles show up PURELY in the heterozygous.
- ◆ three phenotypic possibilities

### ◆ Ex:

- ◆  $R$  = white
- ◆  $R'$  = red
- ◆  $RR$  = white
- ◆  $RR'$  = white with red spots
- ◆  $R'R'$  = red

## Codominance

## Codominance

## Practice

- ◆ In some chickens, the gene for feather color is controlled by codominance. The allele for black is  $B$  and the allele for white is  $B'$ . The heterozygous phenotype is known as erminette.
- ◆ If two erminette chickens were crossed, what is the probability that:
  - a) They would have a black chick?
  - b) They would have a white chick?

## Multiple Alleles

- ◆ there are more than two alleles for one characteristic.
  - ◆ you still only inherit one from each parent
  - ◆ There are more than three possible combinations.

## Multiple Alleles

### ◆ Example

- ◆ Human blood types
- ◆ Three possible alleles:
  - ◆  $I^A$  = Type A
  - ◆  $I^B$  = Type B
  - ◆  $i$  = Type O

## Blood Groups

### Genotypes

- ◆  $I^A I^A$
- ◆  $I^A i$
- ◆  $I^B I^B$
- ◆  $I^B i$
- ◆  $ii$
- ◆  $I^A I^B$

### Phenotypes

- ◆ Type A
- ◆ Type A
- ◆ Type B
- ◆ Type B
- ◆ Type O
- ◆ Type AB

## Blood Groups Practice

- ◆ Sara has Type O blood. What is her genotype?
- ◆ Mark has Type B blood. What is his genotype?
- ◆ Gert has Type AB blood. What is her genotype?

## Blood Groups Practice

- ◆ Bob has Type A blood and Debbie has Type B blood. Is it possible for them to have a child with Type O blood?

## Blood Groups Practice

- ◆ If Roger is heterozygous for Type A blood and Lisa is heterozygous for Type B blood..
  - ◆ A. What are the chances they could have a child with Type O blood?
  - ◆ B. What are the chances they could have a child with Type AB blood?

## Polygenic traits

- ◆ When more than ONE pair of genes affects a trait
  - ◆ many, many phenotypic outcomes
  - ◆ Ex. Human height, weight, skin color, hair color

## Polygenic Inheritance

## Polygenic Inheritance

## Polygenic Inheritance

## Epistasis

- ◆ One gene alters the phenotypic expression of a second gene
- ◆ Examples:
  - ◆ Wheat kernel color
  - ◆ Squash fruit shape
  - ◆ Sweet pea flower color

## Coat color in Labrador retrievers

- ◆ One gene determines the pigment color
  - ◆ B=black
  - ◆ b=brown
- ◆ The other gene determines whether the pigment will be deposited
  - ◆ E=pigment
  - ◆ e=no pigment
